

How old is your pet, *really*?

The health of your pet can change rapidly as he or she ages.

Beginning at around age 7, your pet enters his or her senior years. Often, pets may begin to develop diseases common to their senior human counterparts such as diabetes, heart disease, hypothyroidism and cancer. These diseases can go unnoticed in their early stages and changes can occur quickly, therefore, preventive healthcare is very important.

First, identify your pet's medical years using this chart. Then, we'll discuss ways to keep your pet healthy.
